

Midterm #1 Solutions – EECS 145L Fall 2010

1.1

$$V_0 = (k/f)(V_1 - V_2) \quad V_2 = V_0 R_1 / (R_1 + R_2)$$

$$V_0 = (k/f)V_1 - (k/f)V_0 R_1 / (R_1 + R_2)$$

$$V_0 [1 + (k/f)R_1 / (R_1 + R_2)] = V_1 (k/f)$$

$$G = V_0 / V_1 = \frac{k/f}{1 + (k/f)R_1 / (R_1 + R_2)} = \frac{1}{(f/k) + R_1 / (R_1 + R_2)} = \frac{R_1 + R_2}{(f/k)(R_1 + R_2) + R_1}$$

[10 points off for $G = (R_1 + R_2)/R_1$]

1.2

$$G = V_0 / V_1 = \frac{1 + 999}{1 + (1 + 999)(f / 10^6)} = \frac{1000}{1 + f / 10^3} = \frac{10^6}{10^3 + f}$$

$$G = 1000 \text{ at } f \ll 10^2 \text{ Hz}$$

$$G = 909 \text{ at } f = 10^2 \text{ Hz}$$

$$G = 500 \text{ at } f = 10^3 \text{ Hz}$$

$$G = 90.9 \text{ at } f = 10^4 \text{ Hz}$$

$$G = 9.90 \text{ at } f = 10^5 \text{ Hz}$$

$$G = 0.999 \text{ at } f = 10^6 \text{ Hz}$$

$$G = 0.100 \text{ at } f = 10^7 \text{ Hz}$$

$$G = 0.010 \text{ at } f = 10^8 \text{ Hz}$$

Midterm #1 Solutions – EECS 145L Fall 2010

2.1

Infinite open-loop op-amp gain: virtual short rule: $V_+ = V_-$

$$\frac{V_1 - V_-}{R_1} = \frac{V_- - V_0}{R_2} \quad \frac{V_2 - V_+}{R_1} = \frac{V_+}{R_2}$$

$$V_1 R_2 - V_- R_2 = V_- R_1 - V_0 R_1 \quad V_2 R_2 - V_+ R_2 = V_+ R_1$$

Subtracting, $(V_2 - V_1) R_2 = V_0 R_1$

$V_0 = (V_2 - V_1)(R_2/R_1)$

[7 points off if not in terms of resistors]

2.2 Differential gain $V_0 = G_{\pm}(V_2 - V_1) + G_C(V_2 + V_1)/2$

$G_{\pm} = R_2/R_1$ Since V_0 does not depend on $(V_1 + V_2)$, $G_C = 0$

3.1

3.2

The LPF needs to have a gain $G_1 = 0.9$ at $f_1 = 20$ kHz and drop to a gain $G_2 = 0.001$ at $f_2 = 52$ kHz. So we need a filter that has $f_2/f_1 < 2.6$.

n	f_1/f_c	f_2/f_c	ratio	
4	0.834	5.623	6.74	n too low
6	0.886	3.162	3.57	n too low

Midterm #1 Solutions – EECS 145L Fall 2010

8 0.913 2.371 2.55 n = 8 OK
 10 0.930 1.995 2.15 n high, but OK

$$(20 \text{ kHz}/0.913) < f_c < (60 \text{ kHz}/2.371)$$

$$21.91 \text{ kHz} < f_c < 21.93 \text{ kHz}$$

LPF n = 8, $f_c = 21.92 \text{ kHz}$

[3 points off for $f_c = 20 \text{ kHz}$, which would make the gain 0.707 (too low) at 20 kHz]

[3 points off for n = 12 or 14]

The HPF needs to have a gain $G_1 = 0.9$ at 100 Hz and drop to a gain $G_2 = 0.001$ at 2 Hz. So we need a filter that has $f_1/f_2 < 50$

n	f_1/f_c	f_2/f_c	ratio	
2	1.437	0.032	44.9	n = 2 OK
4	1.199	0.178	6.74	n = 4 high, but OK

$$(2 \text{ Hz}/0.032) < f_c < (100 \text{ Hz}/1.437)$$

$$62.5 \text{ Hz} < f_c < 69.6 \text{ Hz}$$

HPF n = 2, $f_c = 65 \text{ Hz}$

[3 points off for $f_c = 100 \text{ Hz}$, which would make the gain 0.707 (too low) at 100 Hz]

This HPF has a gain just a bit below 0.7 at 60 Hz and does not meet the gain requirement of 0.01. A notch filter with accurate components should provide the necessary low gain.

Note: an alternative solution to the notch filter was to use a 10th or 12th order HPF to reduce the gain from 0.9 at 100 Hz to 0.01 at 60 Hz- although this solution uses 2 or 3 more op-amps, costs more, and has more components that can fail, it was accepted.

4.1

[2 points off for not producing an output that varied from 0 to 10 V as the liquid level varied from 0 m to 10 m]

[5 points off for not providing a buffer amplifier between the 10 kΩ sensor resistor and the readout circuit; this is an inferior design where the output voltage is not linearly proportional to liquid level]

4.2 The relationship between liquid height h (in meters) and output voltage V (in volts) is $V = h$

Midterm #1 Solutions – EECS 145L Fall 2010

An rms uncertainty of 1 mV in V produces an rms uncertainty in liquid height of 1 mm.
[2 points off for mV]

- 4.3** Determining the change in the liquid level per minute requires making two measurements one minute apart and taking the difference. Making two measurements a and b exactly one minute apart results in a measurement of the change in liquid level $f = a - b$ (in mm per minute).

$$\sigma_a = \sigma_b = 1 \text{ mm (from part 4.2)}$$

$$\sigma_f^2 = \sigma_a^2 + \sigma_b^2 = 2 \text{ (mm/min)}^2$$

$$\sigma_f = 1.414 \text{ mm / min} \quad (1.4 \text{ mm was accepted for full credit})$$

[2 points off for 1.414 mV/min]

[3 points off for 1 mm/min or 2 mm/min]

[4 points off for 1 mV/min or 2 mV/min]

[5 points off for 0.01%/min]

[6 points off for 1 mV or 2 mV]

Note 1: The equation sheet said that if $f = k(a - b)$ then $\sigma_f^2 = k^2(\sigma_a^2 + \sigma_b^2)$

Note 2: The rate of change in liquid level is measured in mm/min, not mV or mV/min.

145L midterm #1 grade distribution:

Problem

1	21.9 (5.1 rms) (25 max)
2	22.2 (6.0 rms) (25 max)
3	26.7 (7.6 rms) (30 max)
4	14.2 (5.6 rms) (20 max)

maximum score = 100
average score = 85.0 (B) (19.2 rms)

< 55	3	F
