## Quiz 2 Solutions

(1) (a) The binary string " $\mathbf{1 0 1 1 0 1 0 1}$ " is the $\mathbf{8}$-bit two's complement representation of a fixed point number. What is its decimal value?

## 1(a) (5pts)

$$
10110101=\_-75 \_10
$$

(b) Design a circuit to compute the two's complement of a 3-bit binary number. The inputs are $\mathrm{b}_{0}$, $b_{1}$ and $b_{2}$, where $b_{2}$ is the most significant digit and the outputs are $c_{0}, c_{1}$ and $c_{2}$ where $c_{2}$ is the most significant digit.
(i) Show a truth table for the circuit.
(ii) Draw Karnaugh maps for each output and use them to simplify the functions.
(iii) Draw a schematic diagram using the minimum number of NAND gates and inverters only.

(i) Truth table:

| $\mathbf{b}_{2}$ | $\mathbf{b}_{1}$ | $\mathbf{b}_{\mathbf{0}}$ | $\mathbf{c}_{\mathbf{2}}$ | $\mathbf{c}_{1}$ | $\mathbf{c}_{\mathbf{0}}$ |
| :--- | :--- | :--- | :--- | :--- | :--- |

(ii) Karnaugh Maps:

$\mathrm{c} 2=\mathrm{b} 2^{\prime} \mathrm{b} 0+\mathrm{b} 2^{\prime} \mathrm{b} 1+\mathrm{b} 2^{\prime} \mathrm{b} 1^{\prime} \mathrm{bO}^{\prime}$

$\begin{aligned} \mathbf{c} 1 & =\mathbf{b} 1^{\prime} \mathbf{b 0}+\mathbf{b} 1 \mathbf{b 0} \mathbf{0}^{\prime} \quad \mathbf{c 0}=\mathbf{b 0} \\ & =\mathbf{b} 1 \times \operatorname{xor} \mathbf{b 0}\end{aligned}$
= b1 xor b0

(2) You are to design a "Manhattan Compass" which is an automobile accessory which has four display lights labelled North, South, East, and (yes, you guessed it...) West. One of the lights is always lit and indicates which direction the car is facing. There are two sensors on the steering wheel, labelled Right and Left. The wires connected to each of the right and left sensors has the value 1 when the position of the steering wheel is to the right or left of center respectively and a value of 0 otherwise. In addition, there is a button labelled INIT which, when pushed, tells the system that the car is stationary, the steering wheel is centered (neither right nor left) and the car is facing north. In Manhattan, all turns are exactly 90 degrees once initiated (U turns are not permitted). Your design is to be a clocked synchronous circuit of the Moore form. Assume the clock signal CLK is derived from the left and right signals.
(a) Provide a state transition graph for a Moore implementation of the compass. Use the minimum number of states.
(b) Provide a state table for the compass.
(c) Derive the flip-flop input equations and compass output equations for an implementation which uses clocked D flip-flops. Assume the INIT signal is used to reset the flip flops. Draw a schematic diagram for your circuit, including the D flip-flops and a minimum number of logic gates (no multiplexors!). Show all Karnaugh maps used.
