

**CS3, Fall 1996  
Midterm #2  
Professor Grillmeyer**

**Problem #1 (20 points)**

A) Write a function `exaggerate` that takes a list and returns a list with all the top-level numbers in the argument list squared. Here are some sample calls.

```
> (exaggerate '(my car does 0 to 60 mph in 10 seconds))  
(my car does 0 to 3600 mph in 100 seconds)  
> (exaggerate '(these numbers: 3 4 5 but not these (6 7 8)))  
(these numbers: 9 16 25 but not these (6 7 8))
```

```
(define (exaggerate a-list)
```

B) Is your function above tail or embedded recursive?

**Problem #2 (14 points)**

Someone proposes the following function to work with `exaggerate` that will square numbers deep within sublists as well.

```
(define (exaggerate-all a-list)  
  (cond ((null? a-list) '())  
        (else (if (list? (first a-list))  
                  (cons (exaggerate (first a-list))  
                        (exaggerate-all (rest a-list)))  
                    (exaggerate-all a-list)))))
```

A) Assuming that `exaggerate` works properly with numbers on the top-level, show a sample call to `exaggerate-all` with a two element list that returns a list with **all the numbers squared**. The two blanks below represent the two elements in the argument to `exaggerate-all`. Numbers should appear somewhere in your answer.

```
(exaggerate-all '( _____ ))
```

B) Fill in the blanks to show an example call to `exaggerate-all` with a two element list that **does not square any of the numbers** in its argument list. Numbers should appear somewhere in your answer.

```
(exaggerate-all '( _____ ))
```

C) Fill in the blanks to show a call to `exaggerate-all` with a two element list that **produces an error**. Numbers should appear somewhere in your answer. Indicate what the error is as well.

```
(exaggerate-all '( _____ ))
```

Error: \_\_\_\_\_

### Problem #3 (16 points)

Complete the function `num-list` below to return a list of numbers that occur anywhere within a list. For example,

```
> (num-list '(the (1 answer is (always 42))))
(1 42)
```

Complete the function below.

```
(define (num-list a-list)
  (cond ((null? _____) _____)
        ((number? _____) _____)
        ((atom? _____) _____)
        (else
         (_____
          (num-list _____)
          (num-list _____)))) )
```

### Problem #4 (10 points)

What do the following Scheme expressions evaluate to? If they produce errors, indicate what the errors are. Assume that the following expressions have been entered previously.

```
(define formula (* 4 (+ 2 3)))
(define answer '(/ 91 7))
```

Write your answers in the space below each Scheme expression.

`(atom? formula)``(and 0 1 2)``(number? answer)``(or 0 1 2)``(intersection 421 21)``(equal? 1 (rest '(0 1)))``(if 0 1 2)``(cond ((not formula)  
 (formula)))``(cond (0 1 2))``(min '(1 -2 3))`**Problem #5 (3 points)**

Write out the list representation of the tree below using the format presented in Chapter 7 - leaves are atoms.

**Problem #6 (12 points)**

The function `fringe` takes a binary tree, *tree*, that is in the form presented in Chapter 7 of the reader - leaves are atoms. The function returns a list of all the leaves in *tree*. For example,

```
> (fringe '(* (+ 18 67) xyzzy))
(18 67 xyzzy)
```

```
> (fringe '())
()
```

Complete the function `fringe`

```
(define (fringe tree)
  (cond ((null? _____)
        _____)
        ((atom? _____)
         _____)
        (else
         (_____
          (fringe _____)
          (fringe _____))))))
```

**Problem #7 (6 points)**

Given the functions below:

```
(define (abc xyz)
  (cond ((first xyz) (rest xyz))
        (else (abc xyz))))
```

```
(define (def uvw)
  (or (zero? (first uvw)) (def (rest uvw))))
```

A) What does the call `(abc '(#f #t))` return?B) What does the call `(def '(1 0 2))` return?**Problem #8 (14 points)**

Given the two functions below:

```
(define (unknown n)
  (cond ((= n 0) 'stop)
        (else (what n n)
              (unknown (- n 1)))))
```

```
(define (what x y)
  (cond ((= x 0) (newline) x)
        (else (display y)
              (what (- x 1) y))))
```

A) Show all output from **display** and **newline** when the

call (unknown 4) is made? **Do not show the final return value.**

B) What is the **return value** of the call (unknown 100) ?

C) Write out the output from **display** and **newline** from the call (unknown 4) given that the actions in the **else** clause of unknown are reversed to be

```
(else (unknown (- n 1))
      (what n n))
```

D) What is the **return value** of the above call to the new unknown ?

E) Now we'll swap the else actions of **what** so it is

```
(else (what (- x 1) y)
      (display y))
```

Show the **output and the return value** as the computer would print of the call (what 3 3) .

---
