# EE 105, Fall 1999 <br> Midterm \#1 <br> Professor Costas J. Spanos 

(Note: Greek letters are in caps, "micro" is represented by a 'u'.)

## Problem 1 of 3. Answer each question briefly and clearly. (35 points)

What happens to $\mathrm{n}_{\mathrm{i}}$ if the temperature increases? Give a brief qualitative explanation (5 pts)

What is the concentration of holes, electrons and positive / gnegative ions if $\mathrm{Si}_{\mathrm{i}}$ is doped with $10^{\wedge} 17$ Boron atoms $/ \mathrm{cm}^{\wedge} 3$, and $10^{\wedge} 19$ As atoms $/ \mathrm{cm}^{\wedge} 3$ at room temperature? $\left(\mathrm{n}_{\mathrm{i}}=10^{\wedge} 10\right)(5 \mathrm{pts})$

What are the three types of charges in an MOS capacitor under inversion? Mention carrier type (holes or electrons), ion polarity (positive or negative), charge nature (depletion, accumulation, or inversion) and location (gate, substrate surface or bulk). (Gate is $n+$, bulk is $p$ ) ( 6 pts)

Find the resistance of the following structure (drawn to scale), if the Rs1 (diffusion) is $20 \mathrm{ohms} /$ square, Rs2 (metal) is $1 \mathrm{ohm} /$ square and contact hole conductivity (i.e. the area where the two layers touch) is 1 Siemens/um^2. (1 Siemens $=1 / \mathrm{Ohm})$. Assume that "dogbone" contact areas amount to 0.65 squares. $(6 \mathrm{pts})$

What is the "law" of the junction? (5 pts)

Sketch the minority charge concentration in the bulk of a pn junction under forward bias, and also under reverse bias (no need to calculate the width of the depletion regions - assume that the diode is "short"). (8 pts):

## Problem 2 of 3 ( 40 points)

Follow these steps to create an MOS transistor:
0 . Start with p-type $10^{\wedge} 17 / \mathrm{cm}^{\wedge} 3$ Boron Substrate.

1. Grow $0.5 u m$ of SiO everywhere.
2. Use mask 1 to etch $\mathrm{SiO}_{2}$ where mask 1 is dark.
3. Grow 15 nm SiOz everywhere. (draw cross section after this step)
4. Deposit and pattern 0.5 um of $n+$ poly using mask 2 (poly remains where mask
5. Implant $n+$ regions (to make source and drain) in areas not covered by bpol (draw cross section after this step).
6 . The device is finished by cutting contact holes over source/drain, and by patterning metal (contact hole and metal masks not shown) (10 points).

EECS 105, Midterm \#1, Fall 1999

After the transistor has been completed, apply $\mathrm{V}_{\mathrm{ds}}=0 \mathrm{~V}$, $\mathrm{V}_{\mathrm{BS}}$, and $\mathrm{V}_{\mathrm{GS}}=\mathrm{V}_{\mathrm{tn}}$ to brin to the onset of inversion. Draw phi(x) (with reference to intrinsic silicon) an $\mathrm{X}_{\mathrm{dmax}} . \quad\left(\mathrm{e} 0=8.85 \times 10-14 \mathrm{~F} / \mathrm{cm}, \mathrm{e} 0 \mathrm{x}=3.9 \mathrm{e}_{0}\right.$, $\mathrm{e}_{\mathrm{si}}=11.7 \mathrm{e} 0$, electron charge is $-1.6 \times 1$

Apply $V_{B S}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{DS}}=2 \mathrm{~V}, \mathrm{~V}_{\mathrm{GS}}=3 \mathrm{~V}$ and draw $\mathrm{phi}(\mathrm{x})$ at a spot very close to the so spot very close to the drain. Draw both plots on the same graph, but mark each the bulk potential stays the same, at phi(font size $=1>p$ (/font> with reference in both cases) (15 points).

Consider the small signal model for this transistor at $\mathrm{V}_{G S}=2 \mathrm{~V}, \mathrm{~V}$ VS $=0 \mathrm{~V}$. The larg Vcc is such that the transistor is saturated. Calculate the values of $g_{m}$ and $r_{0}$ $u_{n}=215 \mathrm{~cm}$ ^2V-1s-1, and that the channel-length modulation parameter lambdan is a small-signal source vgs = 1mV, what is the small signal voltage, Vout, across
connected as shown? (Do not take lambdan into account when you calculate $\mathrm{gm}_{\mathrm{m}}$ ).

## Problem 3 of 3 ( 25 points)

Consider a short pn junction with $I_{0}=10^{\wedge}-9 \mathrm{~A}$. You want to make a thermometer by feeding it with a constant forward current of $10^{\wedge}-3 \mathrm{~A}$, and by reading the bi of function of temperature will be this voltage? (linear or some other kind?) C values for 0,25 , and 100 degrees $C$. Graph the relationship between temperatur (Boltzman's constant is $1.38 \times 10^{\wedge}-23 \mathrm{~J} / \mathrm{K}$. The absolute zero temperature is at 0 (15 points).

How would a npn BJT be affected by the following parameters (draw up or down ar indicate that a parameter increases or decreases, respectively, given an increa the respective design variable.) (10 points)

| Design Variable | $\beta_{\mathrm{F}}$ | $\alpha_{\mathrm{F}}$ |
| :--- | :---: | :---: |
| Emitter Doping |  |  |
| Emitter Width |  |  |
| Base Doping |  |  |
| Base Width |  |  |
