## Problem \#1 Discrete Fourier Transform (DFT) (40 points)

As discussed in class and in the DFT handout, the block diagram below represents the operations involved in finding t DFT of a time signal $x(t)$.
Recall that the DFT of length $N$ sequence $\mathrm{x}[n]$ is $\mathrm{X}[k]=\operatorname{sum}\left(\mathrm{x}[n] * e^{\wedge}(-j * 2 * p i * n * k / N), n=0, n=N-1\right) . \mathrm{X}[k]$ values can be found by using the block diagram
to find $\mathrm{X}^{\prime}(\mathrm{w})$ and then noting that $\mathrm{X}[k]=\mathrm{To} /(2 * \mathrm{pi})^{*} \operatorname{area}\left\{\mathrm{X}^{\prime}\left(k^{*} 2 * \mathrm{pi} / \mathrm{To}\right)\right\}$. For each part below, with $\mathrm{Ts}=1$ second, To seconds, match the time samples
$\mathrm{x}[n]$ (= area $\left\{\mathrm{x}^{\prime}(\mathrm{nTs})\right\}$ (1 pt. each) and DFT samples $\mathrm{X}[k]$ (4 pts. each) with the time signal $x(t)$.
The window function: $\mathrm{w}(\mathrm{t})=\{0$ if $t<0-, 1$ if $0-<=t<16-, 0$ if $16-<=t$
Hint: $w(t) \sim=P I[(t-T o / 2) / T o]$
For each part, pick the letter of the matching plot from the next pages. Hint \#1: All X[k] are real. Hint \#2: x[n] are A-F $\mathrm{X}[k]$ are I-P.

a) $\mathrm{x} 1(t)=\cos \left(\mathrm{pi}^{*} t / 8\right)$
---->x $1[n]$ is plot:
---->X1[k] is plot:
b) $\mathrm{x} 2\left(t 0=\cos \left(\mathrm{pi}^{*} t / 4\right)\right.$
$---->\mathrm{x} 2[n]$ is plot:
---->X2[k] is plot:
c) $\mathrm{x} 3(t)=\cos (\mathrm{pi} * t / 2)$
---->x3[n] is plot:
---->X3[k] is plot:
d) $x 4[n]=\{\cos (n * \mathrm{pi} / 8)$ if $n$ even, 0 if $n$ odd
---->x4[n] is plot:
---->X4[k] is plot:

e) $x 5(t)=$
$---->x 5[n]$ is plot:
---->X5[k] is plot:
f) $x 6(t)=\cos \left[\mathrm{pi} / 3^{*}(t-\mathrm{To} / 2)\right]$
---->x6[n] is plot:
---->X6[k] is plot:

g) $x 7(t)=$
---->x7[n] is plot:
---->X7[k] is plot:

h) $x 8(t)=$
$---->x 8[n]$ is plot:
---->X8[k] is plot:

## Problem \#2 (42 points)

Let $m(t)=\frac{\sin 1000 \pi t}{1000 \pi t} . \quad F\{m(t)\}=M(\omega)=\Pi\left(\frac{\omega}{2000 \pi}\right)$

(10 pts.) a) Let $\mathrm{x} 1(t)=m(t) \cos (4000 * \mathrm{pi} * t)$. Sketch $\mathrm{x} 1(t)$ for $0<=t<=2 * 10^{\wedge}-3 \mathrm{sec}$, labeling peak height and accurately indicating zero crossings.

Sketch $\mathrm{X} 1(\mathrm{w})$, labeling height/area, center frequency, and sideband frequencies.
(10 pts.) b) Let $\mathrm{x} 2(t)=(1+m(t)) \cos \left(4000^{*} \mathrm{pi} * \mathrm{t}\right)$. Sketch $\mathrm{x} 2(t)$ for $0<=\mathrm{t}<=2^{*} 10^{\wedge}-3 \mathrm{sec}$, labeling peak height and accurat indicating zero crossings.

Sketch X2(w), labeling height/area, center frequency, and sideband frequencies.
$(6 \mathrm{pts}.) \mathbf{c}) \times 2(t)=(1+m(t)) \cos (4000 * \mathrm{pi} * \mathrm{t})$ is passed through the system shown, with $\mathrm{wf}=1500 * \mathrm{pi}$

Hint: $\mathrm{S}(\mathrm{w})=\operatorname{sum}\left((2 * \sin (k * \mathrm{pi} / 2) / k) * \operatorname{delta}\left(\mathrm{w}-4000 * \mathrm{p} \mathrm{i}^{*} k\right)\right), k=-$ infinity to + infinity $)$
Sketch $Z(w)$, labeling height area/area, center frequencies, and sideband frequencies for $0<=w<=12000 *$ pi
[Hint: $\mathrm{Z}(\mathrm{w})$ is real and even]
(8 pts.) d) $\times 1(t)=m(t) \cos (4000 * \mathrm{pi} * t)$ is passed through an ideal diode and ideal low pass filter $H(\mathrm{w})$, with $\mathrm{wf}=1500 *$

Approximately sketch $v(t)$, for $0<=t<=2 * 10^{\wedge}-3 \mathrm{sec}$

Is $v(t)$ an accurate estimate of the form of $m(t)$ ? Why or why not?
(8 pts.) e) Let $\mathrm{x} 3(t)=m(t) \cos \left(4000^{*} \mathrm{pi} * t\right)+(m(t) * 1 /(\mathrm{pi} * \mathrm{t})) \sin \left(4000^{*} \mathrm{pi} * t\right)$. Sketch X3(w), labeling height/area, center frequency, and sideband frequencies.

## Problem \#3 (12 points)

You are given modulation $m(t)=\cos (1000 * \mathrm{pi} * t)$, which drives 4 transmitters $\mathrm{a}, \mathrm{b}, \mathrm{c}$, and d. Each transmietter generate new signals $a(t), b(t), c(t), d(t)$ with spectra $\mathrm{A}(\mathrm{w}), \mathrm{B}(\mathrm{w}), \mathrm{C}(\mathrm{w}), \mathrm{D}(\mathrm{w})$ using $m(t)$, as shown below:

For each transmitter, identify the modulation method used (for example, AM - DSB - LC, WB FM, etc.), the channel bandwidth used, and the power efficiency (fraction of power transmitting useful information).

|  | Modulation Method | Channel BW | Power Efficiency |
| :--- | :--- | :--- | :--- |
| $\mathbf{A ( w )}$ |  |  |  |
| $\mathbf{B}(\mathbf{w})$ |  |  |  |
| $\mathbf{C}(\mathbf{w})$ |  |  |  |
| $\mathbf{D}(\mathbf{w})$ |  |  |  |

## Problem \#4 (6 points)

The Federal Communications Commission has assigned you a transmission channel from 1.000 MHz to 1.010 MHz . You have two bandlimited message signals $m 1(t)$ and $m 2(t)$ with spectra $M 1(w)$ and $M 2(w)$, as shown:

Draw a block diagram for a transmitter that could send both messages simultaneously in the given channel bandwidth. Your transmitter contains multiplier blocks, oscillators, and summers only.
