# EE126, Fall 2000 Miderm \#1 Professor Chang-Hasnain 

## Problem \#1 (20 pts)

Given $\mathrm{P}[\mathrm{AlB}]=\mathrm{a}$
\&nbsp \&nbspP[B]=b
\&nbsp \& $n b s p P\left[\left(\mathrm{~B}^{\wedge} \mathrm{c}\right)\left(\mathrm{A}^{\wedge} \mathrm{c}\right)\right]=\mathrm{e}$
Express P[B|A] in terms of $a, b, e$.

## Problem \#2 (20 pts)

A telephone transmission system typically consists of an equipment called a multiplexer, which is capable of multiplexing M active phone lines at a given time. Consider an active phone line transmits 1 packet per fixed time period T, and an inactive phone line, 0 packet per T .

Consider an apartment complex with 48 phone lines; the probability of each line transmitting signal is $p$, and not transmitting signal is $l-p$, where $p=1 / 3$. Let X be the number of packets transmitted per T , and X is a binomial random variable.
$\left(\right.$ Hint: $\left.\mathrm{P}[\mathrm{X}=\mathrm{k}]=\{\mathrm{n}!/[(\mathrm{n}-\mathrm{k})!\mathrm{k}!]\}^{*}\left(p^{\wedge} \mathrm{k}\right)^{*}\left[(1-p)^{\wedge}(\mathrm{n}-\mathrm{k})\right]\right)$
(a) (6 pts) Write down the expressions of the pdf and cdf of X
(b) (7 pts) What is $\mathrm{P}[\mathrm{X}>24]$ ? Express this in formula; you don't need to provide numeric value.
(c) ( 7 pts ) If this apartment decides to use an M-line multiplexer for its transmission system and M (Hint: fraction of lost packes $=$ number of discarded packets/total number of packets produced)

## Problem \#3 (20 pts)

A biased coin is tossed. What is the probability that you have to flip it exactly 8 times to see exactly 3 heads? P (Heads) $=0.6$.

## Problem \#4 (20 pts)

There are 5 accidents/month on a highway. Accidents on this highway are distributed as a Poisson random variable. Find the probability there will be no accidents in a given year.

## Problem \#5 (20 pts)

Tom and Paul roll (2) dice alternatively starting with Tom. Consider they use two fair 6 -faced dice. The player who rolls 6 first wins. They continue to roll until one of them wins. Find the probability that Tom wins.

## Problem \#6 Extra Credit (10 pts)

The occurrence of event B makes A less likely (i.e. P(AIB)\&\#60P(B)). Does the occurrence of event A make $B$ more likely, less likely, or doesn't it matter? Justify your answer.
